

BW-VG320 Serials

Cost-effective Voltage
Dynamic Inclination Sensor

Technical Manual

Introduction

The BW-VG320 Dynamic Inclination Sensor is a cost-effective inclinometer that measures the attitude parameters (roll and pitch) of the motion carrier. The attitude deviation is estimated by a 6-state Kalman filter with appropriate gain and is suitable for tilt measurement in motion or vibration.

The BW-VG320 uses high-quality and reliable MEMS accelerometers and gyroscopes, and guarantees measurement accuracy through algorithms. At the same time, the seal design and strict process ensure that the product can accurately measure the roll angle and pitch angle of the carrier under harsh environment. Through various compensations such as nonlinear compensation, quadrature compensation, temperature compensation and drift compensation, the error caused by interference can be greatly eliminated, and the product precision level can be improved. The BW-VG320 has a digital interface that can be easily integrated into the user's system.

Features

- Nonlinear compensation, quadrature compensation
- Dynamic static measurement
- Special offset tracking algorithm eliminates the drift
- Gyro drift compensation
- 0-5V/0-10V voltage output for optional
- Operating temperature: -40°C~+85°C
- High performance Kalman filter algorithm
- Small size: L103.8 x W55.4 x H26(mm)

Applications

- Ships
- Construction machinery
- Platform stability
- Agricultural machinery

Specifications

Electrical Specifications

Parameter	Condition	Min	Typical value	Max	Unit
Supply voltageDC		12		35	V
Operating current	No load	20	50	60	mA
Output load	Resistive	10			KΩ
	Capacitive			20	nF
Operating temperature		-40		+85	°C
Store temperature		-55		+100	°C

Performance Specifications

Attitude parameter	Dynamic accuracy	0.5°
	Static accuracy	0.1°
	Resolution	0.01°
	Tilt range	Pitch ± 90°, Roll ±180°
Physical characteristics	Size	L103.8 x W55.4 x H26 (mm)
	Weight (including cable)	320g
	Weight (including package)	400g
Interface characteristics	Start delay	<50ms
	Maximum output frequency	100Hz
	Serial communication rate	2400 to 115200 baud rate
	Digital output format	Binary high performance protocol
MTBF	≥90000 hours/time	
Electromagnetic compatibility	According to GBT17626	
Insulation resistance	≥100 MΩ	
Impact resistance	2000g, 0.5ms, 3 times / axis	

Resolution: The measured minimum change value that the sensor can detect and resolve within the measurement range.

Accuracy: The error between the actual angle and the Root mean square(RMS) of the measured angle of the sensor (≥16 times).

Note: The angular and electrical angles of the actual input and the angular measurement of the sensor are angularly steerable.

For example, the output variation range is ±15°, corresponding to -15° output voltage 0V, and 15° output voltage 5V (10V).

For example, the output variation range is ±87°, corresponding to -87° output voltage 0V, and 87° output voltage 5V (10V).

Mechanical Characteristic

Connector	Metal connector (standard cable is 1.5m)
Protection level	IP67
Shell material	Magnesium alloy anodizing
Installation	Three M4 screws

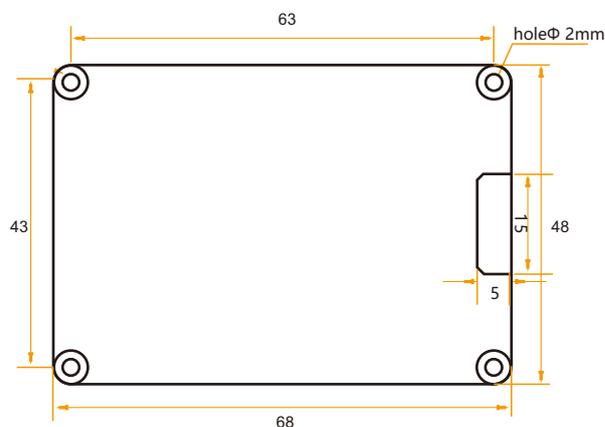

Package size

Product Size: L103.8*W55.4*H26 (mm)

Bare plate product size

Product Size: L68*W48*H12 (mm) , ±1mm error for length and width dimensions, please refer to actual size

Installation direction

The correct installation method can avoid measurement error. The following points should be made when installing the sensor:

First of all, to ensure that the sensor mounting surface and the measured surface completely close, the measured surface should be as horizontal as possible, can not have the angle shown in Figure A and Figure C, the correct installation is shown in Figure B and Figure D.

Secondly, the bottom cable of the sensor and the axis of the measured object shouldn't generate the angle shown in E. When installing, the bottom cable of the sensor should be kept parallel or orthogonal to the rotation axis of the measured object. This product can be installed horizontally or vertically (vertical installation requires customization). The correct installation method is shown in Figure F.

Finally, the installation surface of the sensor must be fixed with the measured surface tightly and smoothly, to avoid measurement error that may be caused by the acceleration and vibration.

Electrical connections

RS232 Electrical interfaces

Cable color & function	RED	BLUE	BLACK	GREEN	YELLOW
	1	2	3	4	5
	VCC DC 12-35V	NC	GND	RXD	TXD

Voltage Type Electrical interfaces

Cable color	RED	BLACK	GREEN	YELLOW	BROWN	ORANGE
function	1	3	4	5	8	9
	VCC	GND	RXD	TXD	X-axis voltage output	Y-axis voltage output

Protocol

1 Data Frame Format: (8 data bits, 1 stop bit, No parity check, default baud rate 9600)

Identifier (1byte)	Frame Length (1byte)	Address Code (1byte)	Command (1byte)	Data (0byte)	Checksum (1byte)
0x77					

Data Format: Hexadecimal

Identifier: Fixed to 77

Frame Length: Length from Frame Length to Checksum (included)

Address Code: Address of acquiring module, default 0x00

Data: Content and length variable according to Command

Checksum: Sum of Frame Length, Address Code, Command and Data. (Please pay attention that when the command or data changes, the checksum will change.)

2 Command Format:

2.1 Read PITCH angle Command: 77 04 00 01 05

Identifier (1byte)	Frame Length (1byte)	Address Code (1byte)	Command (1byte)	Data (0byte)	Checksum (1byte)
0x77	0x04		0x01		0x05

Command response:

Identifier (1byte)	Frame Length (1byte)	Address Code (1byte)	Command (1byte)	Data (3byte)	Checksum (1byte)
0x77	0x07		0x81	SXXX.YY	

Note:The data field is a 3-byte return angle value, which is a compressed BCD code, S is a sign bit (0 positive, 1 negative) XXX is a three-digit integer value, and YY is a two-digit decimal value. The other axis data is the same. For example, 102770 means -27.70 degrees.

2.2 Read ROLL angle Command: 77 04 00 02 06

Identifier (1byte)	Frame Length (1byte)	Address Code (1byte)	Command (1byte)	Data (0byte)	Checksum (1byte)
0x77	0x04		0x02		0x06

Command response:

Identifier (1byte)	Frame Length (1byte)	Address Code (1byte)	Command (1byte)	Data (3byte)	Checksum (1byte)
0x77	0x07		0x82	SXXX.YY	

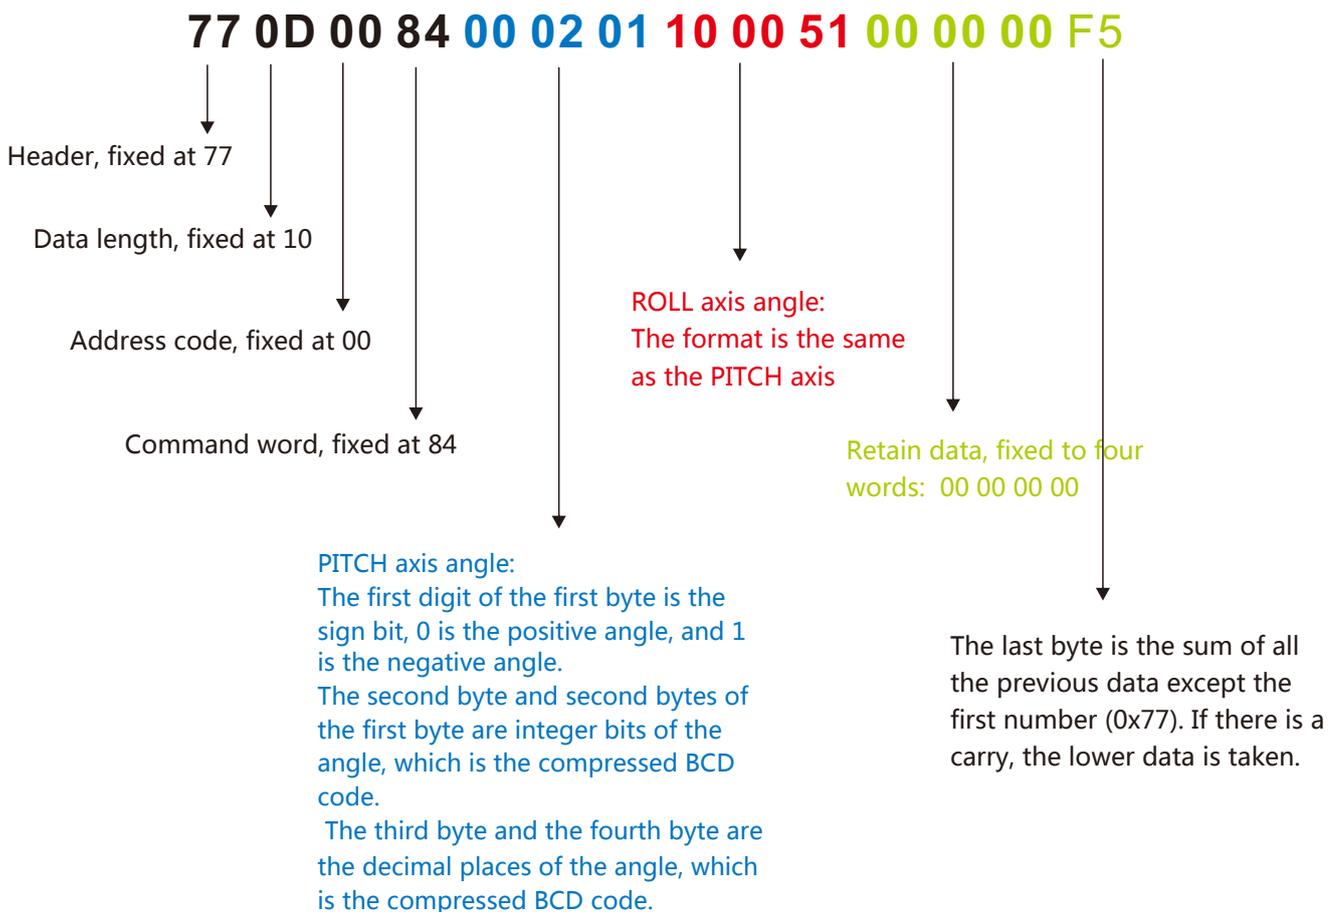

2.3 Read Heading azimuth angle Command: 77 04 00 04 08

Identifier (1byte)	Frame Length (1byte)	Address Code (1byte)	Command (1byte)	Data (0byte)	Checksum (1byte)
0x77	0x04		0x04		

Command response:

Identifier (1byte)	Frame Length (1byte)	Address Code (1byte)	Command (1byte)	Data (3byte)	Checksum (1byte)
0x77	0x0D		0x84	3 SXXX.YY	

PITCH: +2.01°, ROLL: -0.51°

2.4 Set baud rate Command: 77 05 00 0B 02 12

Identifier (1byte)	Frame Length (1byte)	Address Code (1byte)	Command (1byte)	Data (1byte)	Checksum (1byte)
0x77	0x05		0x0B	XX	

Command response:

Identifier (1byte)	Frame Length (1byte)	Address Code (1byte)	Command (1byte)	Data (1byte)	Checksum (1byte)
0x77	0x05		x8B		

Note: 00:2400,01:4800,02:9600,03:19200,04:115200,05:38400,6:57600. If the baud rate is set to 19200, Each time the communication baud rate is changed successfully, the response command is sent back at the original baud rate, and then the device communication baud rate is immediately changed.

Note: If high frequency output is required, set the baud rate to 115200.

2.5 Set address Command: 77 05 00 0F 01 15(Set the module address from 00 to 01)

Identifier (1byte)	Frame Length (1byte)	Address Code (1byte)	Command (1byte)	Data (1byte)	Checksum (1byte)
0x77	0x05		0x0F	XX Address	

Command response:

Identifier (1byte)	Frame Length (1byte)	Address Code (1byte)	Command (1byte)	Data (1byte)	Checksum (1byte)
0x77	0x05	XX	0x0F	YY	

2.6 Query address Command: 77 04 00 1F 23

Identifier (1byte)	Frame Length (1byte)	Address Code (1byte)	Command (1byte)	Data (0byte)	Checksum (1byte)
0x77	0x04	00	0x1F		0x23

Command response:

Identifier (1byte)	Frame Length (1byte)	Address Code (1byte)	Command (1byte)	Data (1byte)	Checksum (1byte)
0x77	0x05	XX	0x1F	XX	

Note: The default address of the sensor is 0x00. When the query address command is sent, the returned data field is the hexadecimal device address.

2.7 Set the automatic output frequency send command: 77 05 00 0C 00 11

Identifier (1byte)	Frame Length (1byte)	Address Code (1byte)	Command (1byte)	Data (0 byte)	Checksum (1byte)
0x77	0x05		0x0C	XX	

Command response:

Identifier (1byte)	Frame Length (1byte)	Address Code (1byte)	Command (1byte)	Data (1byte)	Checksum (1byte)
0x77	0x05		0x8C	0x00	

The data field XX sent is the automatic output frequency option.:

- 00 indicates the answer mode
- 01 means 5Hz automatic output triaxial angle
- 02 means 10Hz automatic output triaxial angle
- 03 means 20Hz automatic output triaxial angle
- 04 means 25Hz automatic output triaxial angle
- 05 means 50Hz automatic output triaxial angle
- 06 means 100Hz automatic output triaxial angle

When the automatic output frequency setting is high, the baud rate needs to be set to a high baud rate.

2.8 Save setting Command: 77 04 00 0A 0E

Identifier (1byte)	Frame Length (1byte)	Address Code (1byte)	Command (1byte)	Data (0 byte)	Checksum (1byte)
0x77	0x04		0x0A		

Command response:

Identifier (1byte)	Frame Length (1byte)	Address Code (1byte)	Command (1byte)	Data (1byte)	Checksum (1byte)
0x77	0x05		0x8A	0x00	

Ordering Information

Product number	Way of communication	Package condition
BW-VG320-05	0-5V/RS232	IP67 Package/Metal Connector
BW-VG320-010	0-10V/RS232	IP67 Package/Metal Connector
